

HOW TO PROPAGATE SECTIONEX LINKS TO THE ENTIRE JOOMLA! FRAMEWORK

1. INTRODUCTION

SectionEx is a perfect component for listing sections and categories in a single layout with many options and filters.

1.a How Joomla works (**skip if you already know**)

J! Framework generates sef urls on the basis of main menu structure for those contents under a section or category linked in main menu.

A typical url is: mysection/mycategory/xx-mycategory/yy-myarticle.html

for a main menu structure like:

```
mysection ----- section-blog
  |___ my category ----- category-blog
```

Alternatively (and cleaner): mysection/xx-mycategory/yy-myarticle.html

for a main menu structure like:

```
mysection ----- section-blog
```

If no menu item is setup for mysection or mycategory url will be:

```
component/content/article/xx-mysection/yy-myarticle.html
```

If a user doesn't create multiple internal links to the same section or category no duplicates will be generated by Joomla itself. By the way If you need for example to replicate main menu items in other menus use external links. This is the well known golden rule to avoid duplicated ids/urls.

1.b How sectionEx works (**skip this too if you already know**)

SectionEx works the same J! way. Tought J! Framework is not capable to track sectionEx main menu item outside sectionEx component pages.

This means if you have some links of myarticle.html out of sectionEx layout (e.g. In frontpage blog, in popular module, etc.) they would be linked as:

```
component/content/article/xx-mysection/yy-myarticle.html
```

even, if you have enabled navigation links you'll have those urls for < prev and next > inside sectionEx layout winding up to a non-shaped page.

2. SOLUTION

To uniform Joomla! Framework generated urls to sectionEx generated ones follow these steps.

2.a You need to instruct Joomla! to generate urls inside mysection (and consequently inside mycategory) the same way sectionEx does:

- create a main menu item mysection ----- section blog layout
- just below create the sectionEx menu item pointing to mysection.

5	<input type="checkbox"/>	more about Joomla!		✓	▲ ▼	4	Public	Articles » Section	37
6	<input type="checkbox"/>	mysection		✓	▲ ▼	5	Public	Articles » Section	41
7	<input type="checkbox"/>	mysection		✓	▲ ▼	6	Public	SectionEx » Category	54
8	<input type="checkbox"/>	The News		✓	▲ ▼	7	Public	Articles » Category / Blog	50

2.b Now it already works, but you'll notice you have 2 links in main menu. Then we have to hide (no delete, nor unpublish) the first one:

you have to add these lines to your stylesheet (tested in ffox2 and I.E.6) :

For standard Rhuk MilkyWay template (has a vertical mainmenu in a module):

```
div.module_menu li.item3 { /* item # depends on the position of menu item you want to hide, 3 is just an example*/
visibility: hidden; /* for compatilby I.E. 6 don't use collapse */
width:0; /*collapse the horizontal blank space left */
height:0; /*collapse the vertical blank space left */
margin:auto !important;
margin:-15px; /* for I.E. 6 */
}
```

For a generic template with horizontal mainmenu (you may have to adjust it a bit according to your template classes)

```
div#menu li.item3 { /* item number depends on the position of menu item you want to hide, 3 is just an
example*/
visibility: hidden; /* for compatilby I.E. 6 don't use collapse */
width:0; /*collapse the blank space left */
clear:none !important;
clear:both; /* for I.E. 6 */ }
```

you're done.

Final notes

Advantages:

1. **Urls Uniformity.** All urls for myarticle.html will be uniformly generated and you can navigate seamlessly inside/outside sectionEx, all frontpage blog links wind up to the right assigned page, breadcrumbs will point to sectionEx layout. All modules links like popular or latest will point to the page assigned.
2. When you click on <prev or next> navigation links you'll remain inside sectionEx menu.
3. SectionEx menu will be always correctly highlighted, when you're arriving from a whatever j! Link.
4. **Reversibility:** if one day you decide to quit using sectionEx you only need to unpublish or delete sectionEx menu item, delete .css class. You'll revert to standard section blog layout and you **won't loose your urls** for your whole content.

Disadvantages:

1. You need to add those lines to your stylesheet, and if you eventually need to change menu ordering you might have to update item id # in .css line 1.

A warm thank to Robert Kuster who kindly make possible to share this at www.joomla.rkuster.com and for his valuable support!

Riccardo Budini www.provisum-studio.com

Soon (in about 2 weeks) I'll publish my site and a showcase of this how-to at www.provisum-illumna.com (still off-line at the moment)
